

TOOLBOX TALK — WEEKLY SAFETY MEETING

Millwork | Carpentry | Interior Finishes | Material Handling

WEEK 03

Date: Supervisor:

Project / Job Name:

TOPIC: Forklift & Telehandler Awareness for Material Deliveries

OVERVIEW:

Material deliveries bring heavy equipment onto the site and create one of the most dangerous windows in a normal workday. Non-operators must understand where to be, where not to be, and how to communicate with operators. Every year, workers are struck or crushed by forklifts because they were in the wrong

TALKING POINTS — Read to Crew:

1. When a forklift or telehandler is operating, you need to treat its entire working area as a danger zone. Stay well outside the travel path and the swing radius of any mast or boom. The tip-over zone — the area where a forklift could land if it rolls — extends several feet to the side of the machine. If you are not sure whether you are in the clear, move further away.
2. Never walk under a raised load. Ever. Forks and loads can fail, slip, or drop without any warning. If material is being lifted or placed overhead, your job is to stay back and out of the fall zone completely. This is not optional. A sheet of plywood or a bundle of lumber falling from height is lethal.
3. Eye contact is your most important tool around lift equipment. Before you walk anywhere near an operating forklift or telehandler, make eye contact with the operator and get a clear signal that they see you and have stopped. Do not assume the operator sees you just because you see them. Operators have limited visibility, especially when traveling in reverse.
4. Only OSHA-certified operators are permitted to operate any powered industrial truck on this site. If you find a forklift unattended with the keys in it, do not move it — even to get it out of the way. Report it to your supervisor immediately. Operating without certification puts you, the equipment, and everyone around you at serious risk.

DISCUSSION QUESTIONS — Ask Your Crew:

- Q1: Where is our designated exclusion zone for deliveries on this project, and who sets it up?
Q2: What do you do if a forklift operator does not see you and is moving in your direction?

KEY SAFETY POINTS:

- Only certified operators may operate forklifts or telehandlers
- Stay out of the swing radius — tip-overs can happen without warning
- Never ride on forks or attachments under any circumstance
- Loads must be stable and fully secured before any travel begins
- Sound the horn at all blind corners and doorways

Crew sign-in sheet on page 2 — all 30 crew members sign on the following page.
