

TOOLBOX TALK — WEEKLY SAFETY MEETING

Millwork | Carpentry | Interior Finishes | Material Handling

WEEK 35

Date: Supervisor:

Project / Job Name:

TOPIC: Lockout/Tagout for Millwork Equipment

OVERVIEW:

Lockout/Tagout is the procedure for isolating hazardous energy before any worker performs service, maintenance, or jam-clearing on powered equipment. In millwork shops and on finish carpentry jobs, LOTO applies to table saws, joiners, planers, CNC equipment, and any machine with moving parts. Failing to

TALKING POINTS — Read to Crew:

1. The purpose of LOTO is to prevent the unexpected energization, start-up, or release of stored energy that could injure a worker during service or maintenance. The key word is unexpected — workers are injured when equipment starts up because a coworker did not know service was in progress, when a machine resets automatically, or when stored energy — compressed air, gravity, or
2. Each worker performing service must apply their own lock to the energy isolation point. This is called personal lockout. One worker cannot lock out for another. If two workers are in a machine, two locks must be on the lockout point. This ensures that no single worker can remove the lock and restore power while another person is still inside the machine. The lock stays on until the worker
3. Verification of zero energy state is required after lockout and before touching any component. After locking out the main power, attempt to start the equipment by pressing the start button. Verify that all moving parts have stopped. Release any residual air pressure in pneumatic systems. Check for stored mechanical energy — elevated components that could fall, springs under tension, or
4. A tagout tag without a lock is a lesser form of protection that is only used when a device cannot be locked. A tag tells others that the equipment is out of service and must not be operated. Unlike a lock, a tag can be accidentally removed or deliberately ignored. On equipment that can be locked out, a lock must always be used in addition to the tag. If the equipment cannot be physically

DISCUSSION QUESTIONS — Ask Your Crew:

- Q1: Walk through the LOTO procedure for the table saw in our shop — where is the lock point and what are the steps?
Q2: Does everyone on this crew have their own personal lock? If not, how do we get them?

KEY SAFETY POINTS:

- Always de-energize AND lock out before reaching into any machine
- Each worker must apply their own personal lock — one lock per person
- Verify zero energy state by attempting to start the equipment after lockout
- Pneumatic tools: bleed the line AND lock the supply valve shut
- Never remove another person's lock — this is a serious safety violation

Crew sign-in sheet on page 2 — all 30 crew members sign on the following page.
